# Sports and Health in America

## REPORT SUMMARY

- **A majority of adults played sports when they were younger, but most do not play anymore.** While only one in four adults (25%) currently play sports, almost three in four adults (73%) aged 30+ played sports when they were younger.
- **When asked the sport they play most often, adults report playing more than 50 different types of sports,** ranging from hockey and fishing to martial arts and bowling. The top five sports played most often by adults overall are golf, basketball, baseball/softball, soccer, and running or track.
- **There is a striking gender gap in sports participation among adults.** Men are more than twice as likely as women (35% to 16%) to say they play sports. The top five sports played by men most often (including ties) are golf, basketball, soccer, baseball/softball, football, and running or track. The top five sports played by women most often are running or track, baseball/softball, tennis, volleyball, and swimming.
- **This gender gap does not exist among children.** Parents of middle school or high school aged children report that most boys and girls (76% and 70%) currently play sports.
- **There is a sharp decline in sports participation among adults as they age.** While 40% of 18-21 year olds and 41% of 22-25 year olds currently play sports, only 26% of 26-49 year olds play sports, and just 20% of adults aged 50+ play sports.
- **Lower-income adults are less than half as likely to play sports as higher-income adults.** Sports participation among adults varies by income, where only 15% of lower-income adults play sports (those with household incomes less than \$25,000/year), while 37% of higher-income adults play sports (those with household incomes of at least \$75,000/year).
- **Parents report that their children also participate in a wide range of sports,** ranging from field hockey and wrestling to volleyball and lacrosse. The top five sports played by boys most often (including ties) are basketball, soccer, football, baseball/softball, swimming, and running or track. The top five sports played by girls most often are basketball, baseball/softball, volleyball, soccer, and running or track.
- **The top two reasons adults say they play sports are for personal enjoyment and health.** A majority of adults who play sports do so for personal enjoyment (55%), while almost one in four (23%) of those who play do so for health-related reasons, including to improve health, to get into or stay in shape, or lose weight.
- **A majority of adults who play sports say it has improved their health.** More than half of adults who play sports report that it has reduced their stress (58%), improved their mental health (54%), or improved their physical health (51%) a great deal or quite a bit. Considering only the top five sports played most often by adults, those who do running or track or play soccer are more likely to say that it has improved their physical health than those who play other sports.

- **For adults who play sports, how they play is important to them.** The vast majority of adults who play sports (85%) say their performance is important to them. Winning is also important to a majority of adults who play sports (56%).
- **Adults who have not played sports in the past year primarily cite health reasons, lack of time, and lack of interest.** Most adults have not played any sports in the past year (75%). The three most frequently mentioned reasons adults say they have not played sports in the past year are health-related reasons (cited by 50% of adults who do not play sports), lack of time (35%), and lack of interest (22%).
- **Most parents place a high priority on their child playing sports.** Most parents of children in middle or high school (76%) say they encourage their child to play sports.
- **Parents who are less well-off are twice as likely to report problems with the costs of their child's sports compared to parents who are more well-off.** When parents whose child plays sports were asked about problems that make it difficult for their child to continue participating, about one in three parents (32%) who are less well-off (household incomes less than \$50,000/year) say that sports cost too much, while just one in six parents (16%) who are more well-off (household incomes \$50,000/year or more) say that sports cost too much.
- **Despite the difficult odds, many parents hope their child will become a professional athlete.** More than one in four parents (26%) whose high school aged child plays sports hope their child will become a professional athlete.
- **About half of adults exercise regularly, and half do not. Among those who exercise, most say they do it for health reasons.** About half of adults (48%) say they do vigorous- or moderate-intensity exercise on a regular basis. The vast majority of adults who exercise report doing so for health-related reasons (71%), including to improve health, get into or stay in shape, or lose weight.
- **Walking and cardio/aerobic activities are the most frequently reported forms of exercise by adults.** When adults who regularly did any vigorous- or moderate-intensity exercise in the past year were asked the type of exercise they did most often, the top five most frequently reported forms of exercise were walking (27% of adults who exercise), cardio/aerobic activities (23%), running or jogging (15%), weight lifting (12%), and biking (6%).
- **Adults who exercise are more likely to have higher incomes, more education, and tend to be younger than adults who do not exercise.** Lower-income adults are less likely to exercise regularly than higher-income adults: 40% of lower-income adults (those with household incomes less than \$25,000/year) say they exercise on a regular basis, while 64% of higher-income adults (those with household incomes of at least \$75,000/year) say they exercise on a regular basis.

## I. Adults' Sports Participation

**A majority of adults played sports when they were younger, but most do not play anymore.** While only one in four adults (25%) currently play sports, almost three in four adults (73%) aged 30+ played sports when they were younger.<sup>1</sup>

**Adults who play sports tend to do so regularly.** Half (50%) of adults who play sports report playing every day or a few times a week, while 21% report playing once a week, 17% report playing a couple of times a month, and 12% report playing once a month or less.<sup>2</sup>

<sup>1</sup> This survey did not define *sports*. Respondents were asked, “In the past year, have you played or participated in any sports, or haven’t you?”

<sup>2</sup> If a respondent plays a sport seasonally, this only refers to the relevant season.

## II. Top Sports Among Adults (Most Frequently Played)

When asked the sport they play most often, adults report playing more than 50 different types of sports, ranging from hockey and fishing to martial arts and bowling. No single sport is played most often by 15% of adults who play sports. While the top five sports played most often by adults overall<sup>3</sup> are golf (13% of sports participants), basketball (11%), baseball/softball (8%), soccer (8%), and running or track (7%), there are significant differences in sports played between men and women, and by adults of different ages.

<sup>3</sup> Respondents were asked, “What sport did you play or participate in most often during the past year?”

### III. The Gender Gap in Adult Sports

**There is a striking gender gap in sports participation among adults.** Men are more than twice as likely as women (35% to 16%) to say they have played sports in the past year. Among younger adults aged 18-29, 48% of men and 23% of women currently play sports.<sup>4</sup> This gender gap persists with age: among older adults aged 65+, men are more than three times as likely as women to say they currently play sports (32% to 9%).

**The top sports among men.** When men who played a sport in the past year were asked what sports they did most often, the top five most frequently reported sports by younger men aged 18-29 were basketball (22% of sports participants), soccer (22%), football (13%), baseball/softball (6%), and running or track (5%). This somewhat differs from the sports played by older men. More than four in ten older men aged 65+ who play sports report that golf (44%) was the sport they played most often during the past year. The remaining top five sports among this age group (including ties) are basketball (6%), baseball/softball (6%), tennis (4%), walking (4%), and fishing (4%).

**The top sports among women.** When women who played a sport in the past year were asked what sports they did most often, the top five most frequently reported sports by younger women aged 18-29 were baseball/softball (16% of sports participants), volleyball (13%), running or track (12%), tennis (11%), and basketball (9%). This differs from the sports played by older women. Women aged 65+ reported their top sports were walking (18% of sports participants), swimming (14%), golf (13%), tennis (11%), and bowling (10%).

---

<sup>4</sup> Currently play sports, meaning that respondents have played or participated in a sport within the past year.

**Sport played most often in past year – top five (in percent)**

1 Golf	44	1 Walking	18
2 Basketball	6	2 Swimming	14
3 Baseball/softball	6	3 Golf	13
4t Tennis	4	4 Tennis	11
4t Walking	4	5 Bowling	10
4t Fishing	4		

#### IV. The Decline of Sports Participation as Adults Age

**There is a sharp decline in sports participation among adults as they age.** While 40% of 18-21 year olds and 41% of 22-25 year olds currently play sports, only 26% of 26-49 year olds play sports, and just 20% of adults aged 50+ play sports.

**A majority of adults in the U.S. played a sport when they were younger, but most no longer play sports now.** While only one in four (25%) of adults currently play sports, almost three in four adults (73%) aged 30+ report playing sports when they were younger.<sup>5</sup>

**Few adults report playing sports in the past year if they did not play sports when they were younger.** Only 3% of adults aged 30+ say that they play sports currently and did not play when they were younger.

Comparing sports played by adults now to those played by adults aged 30+ when they were younger, baseball/softball and basketball are top sports in both youth and adulthood, while football is a top sport only when adults were younger, and golf is a top sport only among adults now.

**About one in three adults who do not play sports still report being physically active.** About one in three adults (32%) say they engage in vigorous- or moderate-intensity exercise but do not play sports. In addition, many adults who currently exercise also currently play sports. Among those who have exercised in the past year, 32% of them have also played a sport.

<sup>5</sup> Currently play sports, meaning that respondents have played or participated in a sport within the past year.

When thinking about sports participation throughout the lifetime, 19% of adults aged 30+ both played sports when they were younger and also play now, while 53% played when they were younger but do not play now.

**Many adults who played sports say they hoped they would become a professional athlete.**

More than one in six (17%) adults aged 30+ who played sports while in high school or college say that they hoped they would become a professional athlete. Among those aged 30+ who played sports when they were younger and still in school, men were significantly more likely than women (23% vs. 9%) to say they hoped they would become a professional athlete. In addition, Hispanic adults aged 30+ who played sports when they were younger and still in school were more likely (30%) than non-Hispanic whites (14%) to say they hoped they would become a professional athlete.

**Adults expect to continue playing sports as they age.** The overwhelming majority of adults who currently play sports (94%) say that it is very likely or somewhat likely that they will be playing sports a year from now, while more than two in three say that it is very likely or somewhat likely that they will be playing sports 10 years from now (68%).

## V. The Income Gap in Adult Sports Participation

**Lower-income adults are less than half as likely to play sports as higher-income adults.** Sports participation among adults varies by income, where only 15% of lower-income adults play sports (those with household incomes less than \$25,000/year), while 37% of higher-income adults play sports (those with household incomes of at least \$75,000/year).

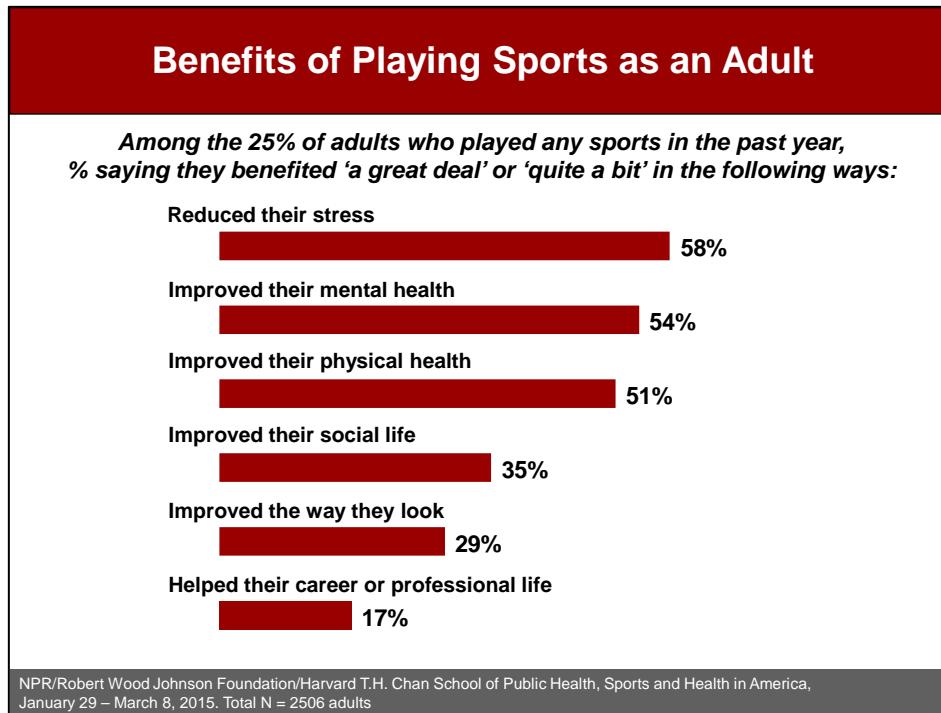

There is also an education gap in sports participation, as adults with less education (graduated high school or less) are much less likely to say they play sports (15%) compared to adults with some college (29%) or college graduates (35%).

## VI. Why Adults Play Sports

**The top two reasons adults say they play sports are for personal enjoyment and health.** When adults who play sports were asked what motivated them the most<sup>6</sup> to play the sport they played most often in the past year, a majority (55%) say they do so for reasons related to personal enjoyment and satisfaction, including that sports are fun, they love it, they do it for personal accomplishment, and for social interaction with teammates. Almost one in four adults (23%) who play sports do it primarily for health-related reasons, including maintaining or improving health, to lose weight, and to stay in shape.

**Adults report that playing or participating in sports has improved their well-being in a variety of ways.** More than half of adults who play sports report that it has reduced their stress (58%), improved their mental health (54%), or improved their physical health (51%) a great deal or quite a bit. Considering only the top five sports played most often by adults, those who do running or track (83%) or play soccer (72%) are more likely to say that it has improved their physical health than those who play other sports.

In addition, about one in three (35%) adults who play sports say that it has improved their social life a great deal or quite a bit, while 29% say it has improved the way they look, and 17% say it has helped their careers or professional lives.

<sup>6</sup> These numbers reflect an aggregate of the top 2 reasons respondents report playing sports

## VII. Sports Performance Among Adults

**For adults who play sports, how they play is important to them.**<sup>7</sup> The vast majority of adults who play sports (85%) say their performance in sports is important to them. Fully half (50%) of adults who play sports report that their performance was very important to them, while 35% say that it is somewhat important. Only 14% of adults who play sports say their performance is not very important or not at all important to them. In addition, a majority of adults who play sports (54%) say that they always (26%) or often (28%) push themselves to their physical limits when they play the sport they play most often.

**Winning is also important to a majority of adults who play sports (56%).** While nearly one in four (24%) adults who play sports say that winning is very important to them when they play, 32% say that winning is somewhat important, and 27% say that winning is not very important or not important at all. Seventeen percent (17%) of adults said they play sports in which it is not possible to win.

<sup>7</sup> When playing the sport they have played most often in the past year.

## VIII. Barriers to Playing Sports Among Adults

**Adults who have not played sports in the past year primarily cite health reasons, lack of time, and lack of interest.** Most adults have not played any sports in the past year (75%). The three most frequently mentioned reasons adults say they have not played sports in the past year are health-related reasons (cited by 50% of adults who do not play sports), lack of time (35%), and lack of interest (22%). Adults cited multiple health-related reasons for not participating in sports, including that they had a health problem other than an injury (16%), they were too old (16%), had a sports-related injury (2%) or other injury (7%), or sports were hard for them to do physically (5%).

**The reasons that adults do not play sports are similar to the reasons why they stop playing sports they participated in when they were younger.** When adults aged 30+ were asked why they stopped playing the sport they played when they were younger, the top reasons they stopped are due to life changes (25%), no longer had enough time (20%), and old age (12%). Most adults (69% of those aged 30+) do not regret no longer playing the sports they played when they were younger, but three in ten (30%) do regret no longer playing sports.

## **IX. Youth Sports Participation**

**Most young people currently play sports, and there is no gender gap in sports participation among young people today.** When parents of middle school or high school aged children were asked what sports their child plays,<sup>8</sup> they reported that most young people (72%) currently play sports in various locations.<sup>9</sup> There is no gender gap in current sports participation between boys and girls (76% and 70%).

**The sports that young people play now are somewhat different than the sports played in previous generations.** Compared to the sports adults aged 30+ played when they were younger and still in school, more children play soccer (14% now vs. 6% in the past), and fewer children play baseball or softball (11% now vs. 17% in the past).

---

<sup>8</sup> Parents were asked about sports participation in the past year for a randomly-selected child in their household in middle school, junior high school, or high school. Does not include any coaching, refereeing, teaching or situations in which the child only watched the sport. Includes any sports participation (inside or outside of school) in the past year.

<sup>9</sup> When surveys focus only on sports participation at school, they estimate that participation in high school sports (including competitive, varsity and intramural) ranges from 53%-56%. See more at: [The National Federation of State High School Associations Athletics Participation Summary](#); Johnston LD, Delva J, O'Malley PJ. [Sports Participation and Physical Education in American Secondary Schools. Am J Prev Med. 2007.](#)

## X. Top Sports Among Young People (Most Frequently Played)

**Parents report that their children participate in a wide range of sports**, ranging from field hockey and wrestling to volleyball and lacrosse. While 41% of parents whose child plays sports say their child does the sport year-round, a majority (58%) say their child only plays during a certain season. According to their parents, the vast majority of children who play sports do so every day (28%) or a few times a week (56%).<sup>10</sup> Just 16% of young people who participate in sports do so once a week or less.

**The top sports among boys.** The top five sports played by boys most often in the past year (including ties) are basketball (17% of sports participants), soccer (17%), football (16%), baseball/softball (11%), swimming (6%), and running or track (6%).

**The top sports among girls.** The top five sports played by girls most often in the past year are basketball (15% of sports participants), baseball/softball (13%), volleyball (13%), soccer (11%), and running or track (8%).

### Sport played most often in past year – top five (in percent)

Responses of parents about their child in middle school, junior high, or high school who played a sport in the past year, by gender/age

Total N = 2506 adults

#### Base: % played/participated in sports, for each group:

	Boys 76%	Girls 70%	
1t Basketball	17	1 Basketball	15
1t Soccer	17	2 Baseball/softball	13
3 Football	16	2t Volleyball	13
4 Baseball/softball	11	4 Soccer	11
5t Swimming	6	5 Running/track	8
5t Running/track	6		

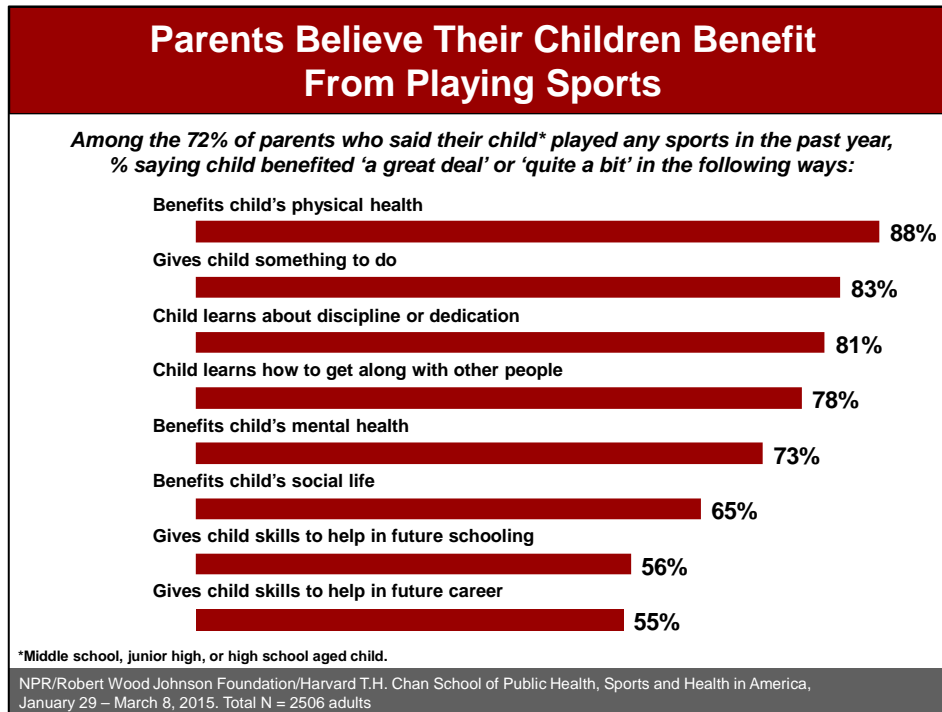

<sup>10</sup> If a child plays a sport seasonally, this only refers to the relevant season.

## XI. Parents' Views on Their Child's Involvement in Sports

**Most parents place a high priority on their child playing sports.** Most parents of children in middle or high school (76%) say they encourage their child to play sports. Only 1% of parents discourage their child from playing sports, and 22% say they don't express a preference.

**In addition, parents hold extremely positive views toward their child's sports participation.** Roughly nine in ten parents whose middle school or high school aged child plays sports (89%) say that their child benefits a great deal or quite a bit from participating in sports. Only 1% of parents whose child plays sports say he/she doesn't benefit very much from it. Among parents whose child plays sports, 37% of parents say they have played or participated in sports with their child in the past year.

**Parents report that playing or participating in sports has improved their child's well-being in a variety of ways.** When parents were asked about the benefits that their middle school or high school aged child gets from playing sports, more than eight in ten parents whose child plays sports say their child benefits a great deal or quite a bit in the following ways: physical health (88%), it gives him/her something to do (83%), or it helps him/her learn about discipline or dedication (81%). More than seven in ten parents say that playing sports benefits their child a great deal or quite a bit in learning how to get along with other people (78%) and his/her mental health (73%). More than half of parents report playing sports benefits their child a great deal or quite a bit in his/her social life (65%), giving him/her skills to help in future schooling (56%), and giving him/her skills to help in a future career (55%).

## XII. Parents' Views on Their Child Playing Sports in the Future

**Parents expect their children to continue playing sports in the future.** The majority of parents (72%) whose child plays sports say it is very likely or somewhat likely that their child will continue playing or participating in sports when he/she becomes an adult, while only 12% say it is not at all likely their child will continue playing.

**Despite the difficult odds, many parents hope their child will become a professional athlete.** More than one in four parents (26%) whose high school aged child plays sports hope their child will become a professional athlete, and these views vary by socioeconomic status. Parents with household incomes of less than \$50,000 a year are significantly more likely to say they hope their child will become a professional athlete compared to parents with household incomes of \$50,000 or more a year (39% to 20%). In addition, parents with less education (graduated high school or less) with a high school aged child playing sports are more likely to say they hope their child will become a professional athlete (44%) than parents who graduated college (9%).

### XIII. Parents' Views on Barriers to Their Child Playing Sports

**If a child has not played a sport in the past year, parents say it is primarily due to a lack of interest.** When parents of children in middle school or high school were asked the two most important reasons why their child did not participate in sports in the past year, the majority of parents say that their child isn't interested in playing sports (51%). More than one in five parents (21%) say it conflicts with other activities. Eight percent (8%) of parents whose children do not play sports say it is primarily due to health-related reasons such as injuries and illnesses.

Parents whose child plays sports were asked the main reasons why they find it difficult for their child to continue participating. Among parents whose middle or high school aged child currently plays sports, the most frequently mentioned problem by parents is that their child would rather spend time on the phone, computer, video games, or TV (34%). Other frequently mentioned reasons include that playing a sport interferes with schoolwork (25%), and it costs too much (22%).

**Parents who are less well-off are twice as likely to report problems with the costs of their child's sports compared to parents who are more well-off.** When parents whose child plays sports were asked about problems that make it difficult for their child to continue participating, about one in three parents (32%) who are less well-off (household incomes less than \$50,000/year) say that sports cost too much, while just one in six parents (16%) who are more well-off (household incomes \$50,000/year or more) say that sports cost too much.

#### **XIV. Sports Injuries and Health**

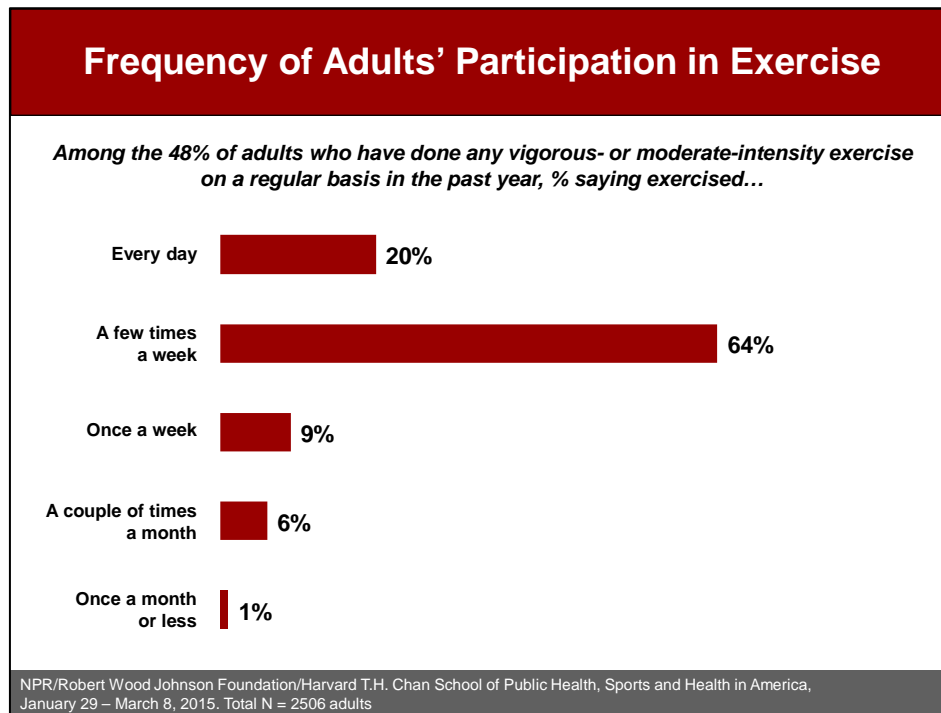

**Many adults report having had sports injuries when they were younger.** Roughly one in four adults (24%) say that they had a sports-related injury that required medical care when they were younger and still in school, including 20% of adults say a sports-related injury kept them from doing that sport for at least some time.

When adults were asked about sports-related injuries that required medical care in the past 5 years, roughly one in ten adults (9%) reported having such injuries.

**A small share of children are impacted by sports injuries, which limits their ability to participate.** When parents of children who play sports were asked about difficulties for their child to continue playing, roughly one in ten parents (9%) say their child had an injury that prevents him/her from participating in sports for at least some time.

## XV. Exercise and Health

**About half of adults exercise regularly, and half do not.** About half of adults (48%)<sup>11</sup> report that they have done vigorous- or moderate-intensity exercise in the past year on a regular basis.<sup>12</sup> Among adults who have exercised in the past year, 20% report exercising every day, while roughly two in three (64%) report exercising a few times a week. Six percent (6%) report exercising a couple of times a month, and 1% report exercising once a month.

**Adults who exercise are more likely to have higher incomes, more education, and tend to be younger than adults who do not exercise.** Lower-income adults are less likely to exercise regularly than higher-income adults: 40% of lower-income adults (those with household incomes less than \$25,000/year) say they exercise on a regular basis, while 64% of higher-income adults (those with household incomes of at least \$75,000/year) say they exercise on a regular basis.

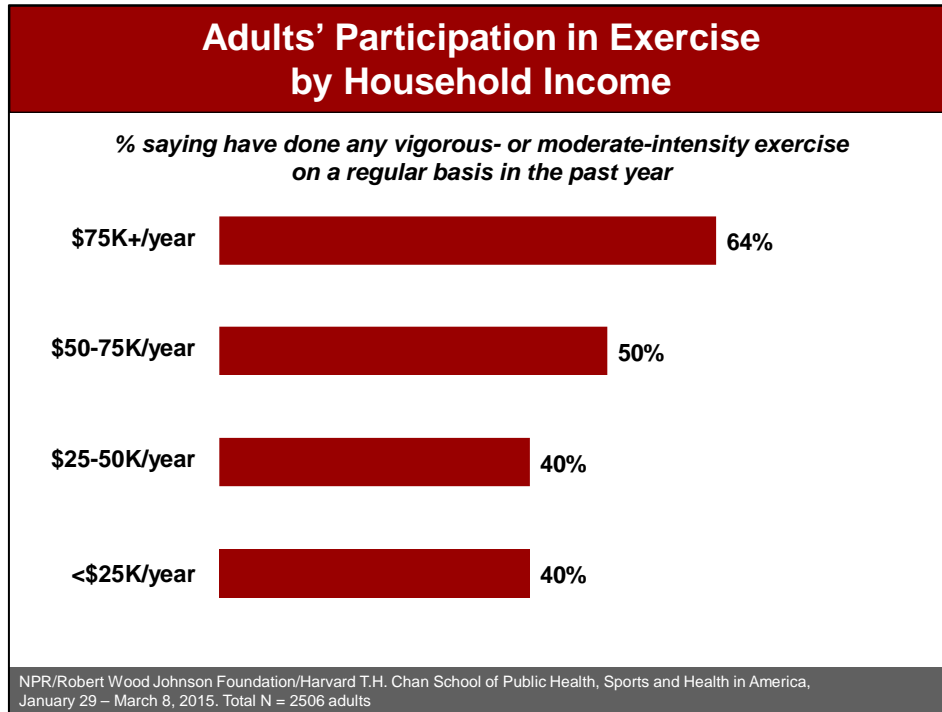

There is also an education gap in exercise participation, as adults with less education (graduated high school or less) are much less likely to say they exercise regularly (33%) compared to adults with some college (50%) or college graduates (65%).

<sup>11</sup> Of note, the Centers for Disease Control & Prevention (CDC) reports that 48% of adults engage in regular physical activity, following the [CDC 2008 Physical Activity Guidelines](#) and the [Department of Health and Human Services' Healthy People 2020](#) goals for the nation.

<sup>12</sup> Respondents who did not play sports were asked “In the past year, have you done any vigorous- or moderate-intensity exercise on a regular basis, or haven’t you? Please do not include exercise that you did as part of a job.” Respondents who played sports were asked “Other than sports, in the past year, have you done any vigorous- or moderate-intensity exercise on a regular basis, or haven’t you? Please do not include exercise that you did as part of a job.”

**Unlike sports participation, exercise participation only slightly declines between when people were younger and adulthood.** While a majority of adults (57%) aged 30+ say they exercised regularly when they were younger and still in school,<sup>13</sup> about half of all adults (48%) say they exercise regularly now.

**Among adults who exercise, most played a sport when they were younger.** Most adults aged 30+ who regularly exercise (77%) say they played a sport when they were younger and still in school. Of note, even among those who do not currently exercise, most adults aged 30+ say they played a sport when they were younger (69%).

<sup>13</sup> Not including physical activities during the school day, such as physical education, gym class or recess.

**Walking and cardio/aerobic activities are the most frequently reported forms of exercise by adults.** When adults who regularly did any vigorous- or moderate-intensity exercise in the past year were asked the type of exercise they did most often, the top five most frequently reported forms of exercise were walking (27% of adults who exercise), cardio/aerobic activities (23%), running or jogging (15%), weight lifting (12%), and biking (6%).

**The vast majority of adults who exercise say they do so for health-related reasons.** When adults who exercise were asked what motivated them the most to do so, 71% reported health-related reasons, including to improve health, get into or stay in shape, lose weight, or because of health problems. Seventeen percent (17%) of adults reported exercising for personal enjoyment or satisfaction.

**Adults report exercising in a variety of locations.** Adults who did vigorous- or moderate-intensity exercise in the past year were asked where they exercise, and adults report exercising in a variety of locations, including at home (74%), at a gym (29%), at a fitness club (25%), at work (20%), and at school (14%).

## **XVI. Conclusions**

While a majority of adults played sports when they were younger, most no longer play sports now. One in four adults currently play sports, and adults report playing more than 50 different types of sports, ranging from hockey and fishing to martial arts and bowling. The top five sports played most often by adults overall are golf, basketball, baseball/softball, soccer, and running or track.

There is a striking gender gap in sports participation among adults, but not among children. Men are more than twice as likely as women to say they play sports. The top five sports played by men most often (including ties) are golf, basketball, soccer, baseball/softball, football, and running or track. The top five sports played by women most often are running or track, baseball/softball, tennis, volleyball, and swimming.

There is a sharp decline in sports participation among adults as they age, and lower-income adults are less than half as likely to play sports as higher-income adults. Adults who play sports do so quite often, winning is important to them, and they expect to continue playing sports as they age. Adults who play sports say they do so primarily for personal enjoyment and health-related reasons. Health reasons (including health problems and injuries), lack of time, and lack of interest are the top reason that adults who do not currently play sports say they have not played in the past year.

Most young people in America now play sports. Parents report that their middle school, junior high, or high school aged children participate in a wide range of sports, ranging from field hockey and wrestling to volleyball and lacrosse. Parents hold extremely positive views toward their child's sports participation, and they report that sports impact their child's well-being in a variety of ways. Parents say their children avoid sports primarily due to lack of interest, though some are also impacted by sports injuries.

Parents also place a high priority on their child playing sports. Most parents of children in middle school or high school say they encourage their child to play sports, and despite the difficult odds, more than one in four parents whose high school aged child plays sports hope their child will become a professional athlete.

Regardless of sports participation, about half of adults say they exercise on a regular basis. Adults who exercise are more likely to have higher incomes, more education, and tend to be younger than adults who do not exercise. Unlike sports participation, exercise participation only slightly declines between when people were younger and adulthood. A majority of adults exercised regularly when they were younger, and about half exercise now. The vast majority of adults who exercise report doing so for health-related reasons, including improving health, getting into or staying in shape, or losing weight. The top five forms of exercise adults do most often are walking, cardio/aerobic activities, running or jogging, weight lifting, and biking.

These findings suggest that sports play different roles in the lives of men, women, and children throughout the lifespan. Sports participation varies widely across different socioeconomic groups, and it is one form of physical activity that adults choose for both health reasons and personal enjoyment. A better understanding of adults' attitudes toward sports participation, as well as their attitudes toward exercise, may impact health in the future.

## Methodology

This poll is part of an on-going series of surveys developed by researchers at the Harvard Opinion Research Program (HORP) at the Harvard T.H. Chan School of Public Health in partnership with the Robert Wood Johnson Foundation and NPR. The research team consists of the following members at each institution.

Harvard T.H. Chan School of Public Health: Robert J. Blendon, Professor of Health Policy and Political Analysis and Executive Director of HORP; John M. Benson, Research Scientist and Managing Director of HORP; Justin M. Sayde, Administrative and Research Manager; and Mary T. Gorski, Research Fellow.

Robert Wood Johnson Foundation: Fred Mann, Vice President, Communications; Carolyn Miller, Senior Program Officer, Research and Evaluation; and Brooke Van Roekel, Director Audience Engagement and Marketing.

NPR: Anne Gudenkauf, Senior Supervising Editor, Science Desk; and Joe Neel, Deputy Senior Supervising Editor, Science Desk.

Interviews were conducted by SSRS of Media (PA) via telephone (including both landline and cell phone) using random-digit dialing, January 29 – March 8, 2015, among a nationally representative probability sample of 2,506 respondents age 18 and older. The interviews were conducted in English and Spanish. The margin of error for total respondents is +/- 2.7 percentage points at the 95% confidence level. The total sample includes oversamples of two groups: (1) adults who said they played or participated in any sport in the past year (1,249 interviews, margin of error +/- 3.4 percentage points); (2) parents of junior high school, middle school, or high school children (604 interviews, margin of error +/- 5.2 percentage points). In the overall results, these two groups were weighted to their actual proportion of adults nationwide.

Possible sources of non-sampling error include non-response bias, as well as question wording and ordering effects. Non-response in telephone surveys produces some known biases in survey-derived estimates because participation tends to vary for different subgroups of the population. To compensate for these known biases and for variations in probability of selection within and across households, sample data are weighted by household size, cell phone/landline use and demographics (sex, age, race/ethnicity, education, number of adults in household and census region) to reflect the true population. Other techniques, including random-digit dialing, replicate subsamples, and systematic respondent selection within households, are used to ensure that the sample is representative.

**Methodology (continued)**

<b>Group</b>	<b>Number of Interviews</b> (unweighted n)
Total adults	2506
Adults who said they played or participated in any sport in the past year (total)	1249
Men who played a sport in past year	817
Women who played a sport in past year	432
Adults age 30 or over (total)	2095
Adults age 30+ who said they played or participated in any sport when they were in junior high school, middle school, high school, or college	1537
Parents of junior high school, middle school, or high school children (total)	604
Parents who said their child played or participated in any sport in the past year	437

**Methodology**

This survey was conducted for National Public Radio, the Robert Wood Johnson Foundation, and the Harvard T.H. Chan School of Public Health via telephone (landline and cell phone) by SSRS, an independent research company. Interviews were conducted using random-digit dialing, January 29 – March 8, 2015, among a nationally representative probability sample of 2,506 respondents age 18 or older.

The total sample includes oversamples of two groups: (1) adults who said they played or participated in any sport in the past year; (2) parents of junior high school, middle school or high school children. In the overall results, these groups were weighted to their actual proportion of adults nationwide.

	Number of interviews	Margin of error (percentage points)
Total adults	2506	+/-2.7
Adults who said they played or participated in any sport in the past year	1249	+/-3.4
Parents of junior high school, middle school or high school children	604	+/-5.2

## I. CURRENT INVOLVEMENT IN SPORTS AND EXERCISE

### a. Who does sports/exercise and what do they do?

1. In the past year, have you played or participated in any sports, or haven't you? Please do not include any coaching, refereeing, teaching or situations in which you only watched the sport.

	%
Yes	25
No	75

**(Respondents who played or participated in any sports in the past year; n=1,249)**

2. What sport did you play or participate in **most often** during the past year?

	%
Golf	13
Basketball	11
Baseball/softball	8
Soccer	8
Running/jogging/trail running or track	7
Football	5
Tennis	5
Swimming/other aquatic exercise (not diving or water polo)	4
Bike riding/dirt biking/mountain biking/cycling/bicycling	4
Volleyball	4
Bowling	3
Walking or race walking	3
Dance (ballet, modern, jazz)/zumba	2
Skiing (general)/downhill skiing/snowboarding	2
Fishing	2
Hiking	2
Cardio/aerobic activities	1
Pilates or yoga	1
Martial arts (karate, tae kwon do, judo, kickboxing, etc.)	1
Ice hockey/hockey	1
Canoeing, rafting, or kayaking (white water)	1
